

6. Dictionaries

1. Introduction to dictionaries: key-value pairs.

What is dictionary ?

- Dictionary is collection data type in python .
- Which store the data in key and value pairs.
- Denoted by {}

Key-Value Pairs

- D={1:"hello"}
- 1 is a key
- "Hello" is a value

2. Accessing, adding, updating, and deleting dictionary elements.

➤ Accessing

- To retrieve a value from a dictionary, use the key inside square brackets or use the .get() method.
- `print(d.get("1"))`
- # Output: hello

➤ Adding

- add a new key-value pair by simply assigning a value to a new key.
- `d["2"] = adding`
- `print(d)`
- # Output: {1:"hello ",2:"adding"}

➤ Updating

- update multiple keys at once using the .update() method.
- `D.update({3:"update ",4:"method"})`
- `Print(d)`
- #output :
`{1:"hello ",2:"adding", 3:"update ",4:"method"}`

➤ Deleting

- `.pop(key)`
- `.popitem()` #automatically delete last inserted item.

3. Dictionary methods like `keys()`, `values()`, and `items()`.

➤ `keys()`

- print only all keys.
- `Print(d.keys())`

➤ `values()`

- print only all values.
- `Print(d.values())`

➤ `items()`

- print all key & values.
- `Print(d.items())`
